No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 1, A Sequence 947, A Sequence 7, App Sequence 7, App

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a ribozyme expression cassette comprising a tetracyclin operator, at least one promotor and a DNA sequence encoding a ribozyme successively from the 5' end. The tetracyclin operator is present at 2 to 10 nucleotides to 5' end from the transcription initiating site of the promotor. The expression cassette is useful in a method for preparing a cell having no sensitivity to HIV, and for inhibiting the growth of HIV. To illustrate the invention, a tet 01-human tRNAVal promoter cassette was constructed, using the present sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9

The invention relates to a nucleic acid enzyme with modifiable RNA cleavage activity. More specifically the invention relates to a nucleic acid enzyme, trans maxizyme, which has selective and effective eradicating activity towards harmful cells by acquiring cleavage activity of a specific target RNA by recognition of the other RNA molecule. The enzyme of the invention is useful for cleaving target RNA and is useful in treating diseases caused by the target RNA. This polynucleotide sequence represents the tRNA-val T-WzL sequence related to the maxizyme enzyme of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 ACCGUUGGUUUCCGUAGUGUAGUGGUUAUCACGUUCGCCUAACACGCGAAAGGUCCCCGG 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a novel maxizyme that can bind to a target mRNA molecule or a molecule having helicase activity. The maxizyme is useful for the prevention and treatment of viral diseases such as human immunodeficiency virus (HIV), hepatitis C or hepatitis B, apoptosis-associated diseases such as Alzheimer's and Parkinson's diseases, cancer, autoimmune diseases, inflammatory diseases and genetic disorders. The maxizyme binds to and cleaves target mRNA irrespective of the higher-order structure of the latter. The present sequence represents a human RNA sequence relating to the present

The present sequence is that of the human tRNA promoter sequences. to the invention for expression of the modified ribozyme sequences. The invention relates to a method for screening of in vivo active floozyme, comprising modification of a candidate ribozyme sequence taken from 8 hammerhead type ribozymes expected to cleave mRNA derived from the p16 gane and for screening for inhibition of expression of a cancer inhibitory gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a nucleic acid enzyme with modifiable RNA cleavage activity. More specifically the invention relates to a nucleic acid enzyme, trans maxizyme, which has selective and effective eradicating activity towards harmful cells by acquiring cleavage activity of a specific target RNA by recognition of the other RNA molecule. The organize of the invention is useful for cleaving target RNA and is useful in treating diseases caused by the target RNA. This polynucleotide sequence represents the tRNA val promoter sequence relating to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 ACCGUUGGUUUCCGUAGUGUAGUGGUUAUCACGUUCGCCUAACACGCGAAAGGUCCCCGG 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 ACCGUGGGUUCCCGUAGGGGUAGGGGUAGCACGUCGCCUAACACACGCGAAAGGUCCCCGG 60
                            left and right arms of a nucleic acid enzyme (maxizyme). The maxizyme has allosteric RNA-cleaving activity on a specific target RNA. The maxizyme can be used for efficient cleavage of RNA molecules at specific points, especially for the prevention and treatment of chronic myeloid lenkemia and Philadelphia chromosome abnormality. The present sequence is used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Enzyme; modifiable RNA cleavage activity; maxizyme-constituting RNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A nucleic acid enzyme which has selective and effective eradicating activity towards harmful cells by acquiring cleavage activity of a specific target RNA by recognition of the other RNA molecule .
The specification describes nucleotide sequences which make up the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

molecules of the invention include ribozymes such as TAR GUU Rz linked to a constitutive transport element (see AAF90344), and expression vectors for such chimeric molecules. These are used in a claimed method to prevent or treat viral diseases, diseases associated with apoptosis or diseases associated with abnormal gene expression. They are also used in a claimed method of specifically cleaving a target nucleic acid, especially a viral gene, protooncogene or a gene associated with apoptosis. Use of the CTE facilitates cleaving of RNA previously considered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ribozyme; constitutive transport element; virucide; gene therapy; HIV-1; tRNAval; promoter; ss.

This invention relates to a novel method for selecting a functional nucleic acid molecule functioning in a cell, cytoplasm or nucleus, comprising constructing an expression vector, introducing the expression vector into a cell, culturing the cell, collecting and preparing an extract of an entire cell, a cytoplasmic fraction or a nuclear fraction, incubacing the extract and obtaining a nucleic acid molecule. The invention also comprises a novel functional nucleic acid molecule which has an increased transcriptional level, stability or activity within cells or exhibits altered intracellular localisation, when compared to a corresponding control nucleic acid molecule. The method of the invention provides a means of obtaining highly functional nucleic acid molecules within cells which have high stability. Furthermore, a molecules within cells which have high stability. Furthermore, a corresponding or system with high efficiency can be developed, based on a linker sequence which a highly functional ribozyme has, and this expression system can be applied for treatment of malignant diseases such as cancers and infectious diseases including acquired immuno deficiency syndrome (AIDS). The present sequence represents the RNA sequence of the tRNA-Luc GUR Rz Ribozyme of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Selecting a functional nucleic acid molecule functioning in a cell, cytoplasm or nucleus using an expression vector which contains a candidate nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /*tag= j

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ij
                                                                                                                                                                                                                                                                                                                                                                                                             comprising a tetracyclin operator, at least one promotor and a DNA sequence emodding a ribozyme successively from the 5 'end. The tetracyclin operator is present at 2 to 10 nucleotides to 5'-end from the transcription initiating site of the promotor. The expression cassette is useful in a method for preparing a cell having no sensitivity to HIV, and for inhibiting the growth of HIV. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 UUCGAAACCGGGCACUACAAACAC------AACACUGAUGAGGACCGAAAGGUCCG 110

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 UUCGAAACCGGGCACUACAAAAACCAACUUUCUAGAGAGCGAGAUCUGAUGAGGCCGAAA 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 ACCGUUGGUUUCCGUAGUGUAGUGGUUAUCACGUUCGCCUAACACGCGAAAGGUCCCCGG 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel chimeric molecule useful for clarifying biological function of target nucleic acid and for treating viral diseases, and Alzheimer's disease, comprises region with binding affinity for molecule capable of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is that of novel ribozyme CPP Rz5, which is targeted to a stem-structured site site in mouse CPP32 mRNA that was previously considered inaccessible. CPP32 is an apoptosis-related encoding procaspase-3. CPP Rz3 was used to demonstrate the high efficacy of hybrid ribozymes linked to a constitutive transport element (CTB, See ARF30944) for inhibition gene expression. B Ribozymes for different sites in CPP32 mRNA were designed (see AAF90992-96). Mouse NIH3T3 cells were transfected with ribozyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 ACCGUUGGUUUCCGUAGUGUAGUGGUUAUCACGUUCGCCUAACACGCGAAAGGUCCCCGG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   expression plasmids and procaspace-3 expression levels were determined by Western blotting after 36 hr. CTE-linked ribozymes were more effective that their conventional counterparts for which they can be expression. The CTE moiety facilitates cleavage of RNA previously considered refractory because of local high-order structure. It binds to RNA helicase A, which has functions of binding to RNA, sliding and unwinding its high-order structure. Chimeric molecules of the invention, including treat viral diseases, diseases associated with apoptosis or diseases associated with apoptosis or diseases associated with apoptosis or are also used in a claimed method of specifically cleaving a target nucleic acid, especially a viral gene, protooncogene or a gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   64.7%; Score 87.4; DB 22; Length 142; 79.8%; Pred.                                                                                                                                                                                1 ACCGUUGGUUUCCGUAGUGUAGUGUUAUCACGUUCGCCUAACACGCGAAAGGUCCCCGG
The invention provides nucleotide sequences of hammerhead ribozymes that can be used as antiviral and gene expression suppression agents. The ribozymes have high stability in vivo. The present sequence represents an example of such a ribozyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention provides nucleotide sequences of hammerhead ribozymes that can be used as antiviral and gene expression suppression agents. The present invention relates to a ribozyme expression cassette comprising a tetracyclin operator, at least one promotor and a DNA sequence encoding a ribozyme successively from the 5' end. The tetracyclin operator is present at 2 to 10 nucleotides to 5'-end from the transcription initiating site of the promotor. The expression cassette is useful in a method for preparing a cell having no sensitivity to HIV, and for inhibiting the growth of HIV. The present sequence was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 UUCGAAACCGGGCACUACAAACAC-----AACACUGAUGAGGACCGAAAGGUCCG 110

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of novel ribozyme CPP R22, which is targeted to a site in mouse CPP32 mRNA. CPP32 is an apoptosis-related gene encoding procespase-3. CPP R22 was used to demonstrate the high efficacy of hybrid ribozymes linked to a constitutive transport clement (CTE, See AAR30944) for inhibition gene expression.

5 Ribozymes for different sites in CPP32 mRNA were designed (see expression plasmids and procespase-3 expression levels were expression plasmids and procespase-3 expression levels were certained by Western blotting after 36 hr. CTE-linked ribozymes were more effective that their conventional counterparts for inhibiting CPP32 gene expression. The CTE molety facilitates cleavage of RNA previously considered refractory because of local high-order structure. It binds to RNA helicase A, which has functions of binding to RNA, sliding and unwinding its high-order structure. Chimeric molecules of the invention, including cTE-ribozymes, and expression vectors, are used to prevent or treat viral diseases associated with apportosis or treat viral diseases associated with abnormal gene expression (claimed). They are also used in a claimed method of specifically cleaving a target not clear acid, sepecially a viral gene, protoncogene or a gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 Accessos de la recesso de la constanción del constanción de la c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel chimeric molecule useful for clarifying biological function of target nucleic acid and for treating viral diseases, and Alzheimer's disease, comprises region with binding affinity for molecule capable of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1 ACCGUUGGUUUCCGUAGUGUAGUGGUUAUCACGUUCGCCUAACACGCGAAAGGUCCCCGG

The present sequence is that of novel ribozyme CPP RZ3, which is targeted to a site in mouse CPP32 mRNA. CPP32 is an apoptosis-related gene encoding procaspase-3. CPP RZ3 was used to demonstrate the high efficacy of hybrid ribozymes linked to a constitutive transport class in Ribozymes for different sites in CPP32 mRNA were designed (see SRibozymes for different sites in CPP32 mRNA were designed (see ARF90392-96). Mouse NHH3T3 cells were transfected with ribozymes conferencing and procaspase-3 expression levels were designed (see ARF90392-96). Mouse NHH3T3 cells were transfected with ribozymes conferencing and procaspase-3 expression levels were conferenced by western blotting after 36 hr. CTE-linked ribozymes conferenced for that their conventional counterparts for inhibiting CPP32 gene expression. The CTE moiety facilitates cleavage of RNA previously considered refractory because of local classage of RNA previously considered refractory because of local cluctions of binding to RNA, sliding and unwinding its high-order cructure. Chimeric molecules of the invention, including cructure. Chimeric molecules of the invention, including cructure cructure associated with approxis or treat viral diseases associated with approxis or diseases associated with abnormal gene expression (claimed). They can also used in a claimed method of specifically cleaving a triget of necessity and seed in a viral gene, protooncogene or a gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 ACCGUUGGUUCCCGUAGUGUAGUGGUUAUCACGUUCGCCUAACACGCGGAAAGGUCCCCGG 60

More specifically the invention relates to anucleic acid enzyme, trans maxizyme, which has selective and effective eradicating activity towards harmful cells by acquiring cleavage activity of a specific target RNA by recognition of the other RNA molecule. The enzyme of the invention is useful for cleaving target RNA and is useful in treating diseases caused by the target RNA. This polynucleotide sequence represents the tRNA-val I-MzL sequence related to the maxizyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1 ACCGUUGGUUCCGUAGUGUAGGGUUAUCACGUUCGCCUAACACGCGAAAGGUCCCCGG 60

The present sequence is that of novel ribozyme CPP Rz1, which is targeted to a site in mouse CPP32 mRNA. CPP32 is an apoptosis-related gene encoding processpase-3. CPP Rz1 was used to demonstrate the high efficacy of hybrid ribozymes linked to a constitutive transport clement (CTE, See AAF30944) for inhibition gene expression.

5. Ribozymes for different sites in CPP3 mRNA were designed (see AAF90329-96). Mouse NUH373 cells were transfected with ribozyme caternined by Western blotting after 36 hr. CTE-linked inbozymes were more effective that their conventional counterparts for inhibiting CPP32 gene expression. The CTE moiety facilitates cleavage of RNA previously considered refractory because of local high-order structure. It binds to RNA helicase A, which has functions of binding to RNA, sliding and unwinding its high-order structure. Chimeric molecules of the invention, including cTE-ribozymes, and expression vectors, are used to prevent or diseases associated with abnormal gene expression (claimed). They are also used in a claimed method of specifically cleaving a target associated with apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1 ACCGUUGGUUUCCGUAGUGUAGUGGUUAUCACGUUCGCCUAACACGCGAAAGGUCCCCGG 60

This invention relates to a novel method for selecting a functional nucleic acid molecule functioning in a cell, cytoplasm or nucleus, comprising constructing an expression vector, introducing the expression vector into a cell, culturing the cell, collecting and preparing an extract of an entire cell, a cytoplasmic fraction or a nuclear fraction, incubating the extract and obtaining a nucleic acid molecule. The invention also comprises a novel functional nucleic acid molecule which has an increased transcriptional level, stability or activity within cells or exhibits altered intracellular localisation, when compared to a corresponding control nucleic acid molecule. The method of the invention provides a means of obtaining highly functional nucleic acid molecules within cells which have high stability. Furthermore, a notence expression system with high efficiency can be developed, based on a linker sequence which a highly functional ribozyme has, and this expression system can be applied for treatment of malignant diseases such as cancers and infectious diseases including acquired immuno deficiency syndrome (AIDS). The present sequence represents the RNA sequence of the tRNA-Luc GUA RZ Ribozyme of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 ACCGUUGGUUUCCGUAGUGUAGUGGUUAUCACGUUCGCCUAACACGCGAAAGGUCCCCGG 60

The maxizyme is useful for the prevention and treatment of viral diseases such as human immunodeficiency virus (HIV), hepatitis C or hepatitis B, apoptosis-associated diseases such as Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Maxizyme binding to a molecule with helicase activity for treatment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           irrespective of the higher-order structure of the latter. The present sequence represents a human RNA sequence relating to the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hara T, Nozawa I;
sequence represents the tRNA-val promoter sequence relating to the maxizyme enzyme of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     diseases, cancer, autoimmune diseases, inflammatory diseases and genetic disorders. The maxizyme binds to and cleaves target mRNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     comprising a tetracyclin operator, at least one promotor and a DNA sequence encoding a ribozyme successively from the 5' end. The tetracyclin operator is present at 2 to 0 nucleotides to 5'-end from the transcription initiating site of the promotor. The expression assette is useful in a method for preparing a cell having no sensitivity to HTV, and for inhibiting the growth of HTV. To illustrate the invention, a tet 01-human tRNAVal promoter cassette was constructed,
                                                                                                         09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   88

                                                                                        The present sequence is that of novel ribozyme CPP R23, which is targeted to a site in mouse CPP32 mRNA. CPP32 is an apoptosis-related gene encoding procespase-3. CPP R23 was used to demonstrate the high efficacy of hybrid ribozymes linked to a constitutive transport element (CTE, See AAR70944) for inhibition gene expression. S Ribozymes for different sites in CPP32 mRNA were designed (see AAR70329595). Mouse NH373 cells were transfected with ribozyme expression plasmids and procespase-3 expression levels were determined by Western blotting after 36 hr. CTE-linked ribozymes were more effective that their conventional counterparts for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                               diseases associated with abnormal gene expression (claimed). They are also used in a claimed method of specifically cleaving a target nucleic acid, especially a viral gene, protooncogene or a gene
                                                                                                                                                                                                                                                                              inhibiting CPP32 gene expression. The CTE moiety facilitates cleavage of RNA previously considered refractory because of local high-order structure. It binds to RNA helicase A, which has functions of binding to RNA, sliding and unwinding its high-order structure. Chimeric molecules of the invention, including CTE-ribozymes, and expression vectors, are used to prevent or treat viral diseases, diseases associated with apoptosis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid enzyme; maxizyme; allosteric RNA-cleaving activity; RNA cleavage; chronic myeloid leukemia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a nucleic acid enzyme with modifiable RNA cleavage activity. More specifically the invention relates to a nucleic acid enzyme, trans maxizyme, which has selective and effective eradicating activity towards harmful cells by acquiring cleavage activity of a specific target RNA by recognition of the other RNA molecule. The enzyme of the invention is useful for cleaving target RNA and is useful in treating diseases caused by the target RNA. This polynucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A nucleic acid enzyme which has selective and effective eradicating activity towards harmful cells by acquiring cleavage activity of a specific target RNA by recognition of the other RNA molecule \cdot
                                                                                                                                                                                                            left and right arms of a nucleic acid enzyme (maxizyme). The maxizy has allosteric RNA-cleaving activity on a specific target RNA. The maxizyme can be used for efficient cleavage of RNA molecules at specific points, especially for the prevention and treatment of chronic myeloid leukemia and Philadelphia chromosome abnormality. The present sequence is used in the course of the invention.
                                                                                                                                                                                           The specification describes nucleotide sequences which make up the

                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a ribozyme expression cassette comprising a tetracyclin operator, at least one promotor and a DNA sequence encoding a ribozyme successively from the 5' end. The tetracyclin operator is present at 2 to 10 nucleotides to 5'-end from the transcription intitiating site of the promotor. The expression cassette is useful in a method for preparing a cell having no sensitivity to HIV, and for inhibiting the growth of HIV. The present sequence was

The invention relates to a method for screening of in vivo active ribozyme, comprising modification of a candidate ribozyme sequence taken from 8 hammerhead type ribozymes expected to cleave mRNA derived from the p16 gene and for screening for inhibition of expression of a cancer inhibitory gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 ACCGUUGGUUUCCGUAGUGUAGUGGUUAUCACGUUCGCCUAACACGCGAAAGGUCCCCGG 60

The ribozymes have high stability in vivo. The present sequence represents an example of such a ribozyme.

The present invention relates to a ribozyme expression cassette comprising a tetracyclin operator, at least one promotor and a DNA sequence encoding a ribozyme successively from the 5' end. The tetracyclin operator is present at 2 to 10 nucleotides to 5'-end from the transcription initiating site of the promotor. The expression cassette is useful in a method for preparing a cell having no sensitivity to HIV, and for inhibiting the growth of HIV. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 UUCGAAACCGGGCACUACAAA----CCAACACACAACACUGAUGAGGACCGAAAGGUCCG 116
